

What kind of cable tray is a metal cable tray

Article Overview

A metal tray-type cable tray is a rigid support system made of metal, designed to organize, protect, and route electrical cables efficiently in industrial and commercial installations.

Overview

A metal tray-type cable tray is a structural system used to support insulated electrical cables for power distribution, control, instrumentation, and communication. Unlike conduits, these trays allow cables to be laid in bundles, providing easy access for maintenance, future expansion, and improved heat dissipation. They are typically made from materials such as galvanized steel, stainless steel, or aluminum, chosen based on environmental conditions and corrosion resistance requirements.

Construction and Design

Metal tray-type cable trays consist of a thin metallic plate or sheet forming the base, often reinforced with electro-welded steel rods or side rails to provide strength and rigidity. They can have:

- Solid bottoms: Offer maximum protection against dust, debris, and electromagnetic interference but may limit ventilation.
- Ventilated bottoms: Include slots or perforations to allow airflow, water drainage, and heat dissipation, which is important for high-current power cables....
