

What kind of support should be used for the cable tray

Article Overview

The type of support cable tray used depends on installation environment, cable load, and accessibility requirements, with options including hanger supports, wall-mounted brackets, floor-mounted supports, Unistrut systems, and vertical supports.

Key Types of Cable Tray Supports

Hanger Supports: Suspended from ceilings, these supports are ideal when floor space is limited. They are adjustable and allow the cable tray to be positioned out of the way while maintaining stability and accessibility for maintenance . **Wall-Mounted Supports:** Used when cable trays need to be attached to walls, common in data centers and industrial environments. They utilize existing wall space and are suitable for horizontal runs along walls . **Floor-Mounted Brackets:** Applied in large industrial areas or corridors where ceiling or wall mounting is not feasible. These supports provide a stable base for cable trays running along the floor . **Unistrut Systems:** Highly versatile, Unistrut supports can be installed from the ceiling, wall, or floor. They are strong, flexible, and suitable for a wide range of cable tray types and loads . **Vertical Supports:** Designed for vertical cable runs, such as between floors in multi-story buildings. They keep cables organized and secure during vertical transitions .

Factors to Consider

- **Load Capacity:** Ensure the support can handle the weight of the cable tray and cables without sagging
