

What wires should be laid in the distribution box

Article Overview

A distribution box should include phase (live), neutral, and ground (earth) wires, properly sized and connected to breakers, busbars, and protective devices for safe and organized power distribution.

Essential Wires

- Phase (Live) Wires
 - Carry current from the main supply to individual circuits.
 - Connect to the main breaker or MCBs (single-pole or double-pole depending on load) inside the distribution box .
 - Each branch circuit should have its own phase wire for proper isolation and protection.
- Neutral Wires
 - Return current to the source and balance the electrical load.
 - Connect to the neutral busbar inside the box.
 - Proper connection is critical to prevent overheating or power issues .
- Ground (Earth) Wires
 - Provide a safe path for fault currents to prevent electric shock.
 - Connect to the earth busbar and ensure all metal parts of the box and appliances are grounded .

Optional or Additional Wires...
