

Where is the optical splitter port on China Unicom broadband

Article Overview

The optical splitter port is typically located inside the ONU/ONT device or in a wall-mounted fiber distribution box, connecting the incoming fiber from the PON to your home network.

Understanding the Optical Splitter in China Unicom FTTH

China Unicom uses FTTH (Fiber to the Home) technology with a PON (Passive Optical Network) system. In this setup, a single fiber from the central office is split to serve multiple homes using a passive optical splitter. The splitter distributes the optical signal to each subscriber, reducing the need for multiple lasers and lowering costs ().

Typical Locations

-

Wall-Mounted Fiber Distribution Box: In many residential buildings, the optical splitter is installed in a metal or ABS fiber distribution box mounted on the wall. This box contains multiple SC-type fiber ports and splits the signal to different units or devices ().

-

ONU/ONT Device: At the subscriber's home, the ONU (Optical Network Unit) or ONT (Optical Network Terminal) receives the fiber signal. The optical port on the ONU/ONT is where the fiber from the splitter is connected. This port is usually labeled as "PON" or "Optical". From here, the ONU/ONT converts the optical signal to Ethernet for yo...
