

Which material is best for electrical distribution boxes

Article Overview

Electrical distribution boxes should be made from materials that provide durability, impact resistance, fire safety, and environmental protection, such as steel, stainless steel, polycarbonate, or thermoset plastics.

Metal Enclosures

Steel and stainless steel are commonly used for industrial or outdoor distribution boxes due to their high strength, impact resistance, and corrosion resistance. Galvanized steel is also popular for outdoor applications because it withstands harsh weather and prevents rust. Metal enclosures are ideal for areas where physical damage is possible or where the box may be exposed to moisture, salt, or UV radiation .

Plastic Enclosures

Engineering plastics like polycarbonate (PC), high-density polyethylene (HDPE), PVC, and thermoset plastics (e.g., SMC or fiberglass-reinforced plastics) are lightweight, non-corrosive, and suitable for indoor or light-duty applications. Polycarbonate and fiberglass-reinforced plastics are particularly strong and shatter-resistant, making them suitable for residential or office environments. Thermoset plastics are also flame-retardant and can handle surge voltages, providing additional safety .
