

Wiring of monitoring lines and distribution box

Article Overview

A distribution box can be wired for monitoring by integrating protective devices, proper busbar connections, and smart sensors for real-time load tracking and fault detection.

Conventional Wiring of a Distribution Box

A standard distribution box (DB) distributes electrical power from the main supply to subcircuits safely. The wiring process typically involves:

- **Incoming Supply Connection:** Phase and neutral lines from the energy meter are connected to the main isolator (DP MCB), which acts as the main switch for the system .
- **Protective Devices:** From the isolator, phase lines are routed to an RCCB (Residual Current Circuit Breaker) or RCD to protect against leakage currents and electric shocks. Neutral lines are connected to a neutral busbar .
- **Subcircuit Distribution:** Phase lines are connected in parallel to MCBs (Miniature Circuit Breakers) for each subcircuit, providing overcurrent protection. Neutral lines are connected to the neutral link .
- **Earthing:** Proper grounding is essential for safety, connecting the earth busbar to all metallic parts and protective devices .
